Twin debut for Striebig

Intelligence matched by ergonomics

Hall 11 at Ligna 2009 is where you will find the stand of Striebig AG of Littau – the Swiss market leader in vertical panel sawing technology is presenting two global innovations: the company's new CONTROL model, which is the world's first vertical panel cutting centre ever, and its new EVOLUTION model, the decisively enhanced top-of-the-range model for manually operated vertical panel saws.

Both saws share the totally newly developed “touch & saw” operating system via a touchscreen panel. A fingertip touch is all it needs to operate all the functions of the machine.

Thanks to this innovative SPS control system, processors can control the use of machine and material even better than ever before. Their use of energy and resources is more economical and, in the final analysis, they cut sawing costs. “General economic and ecological contexts have always been at the focal point of our activities. Particularly at times like these, we feel that it is important to exemplify the topic of sustainability and efficiency when using materials and energy. With the new saws, we are giving processors machines with which they can meet this requirement to perfection”, said Striebig business manager Marcel Brunner in Hanover.

Since their inception, the company's CONTROL and EVOLUTION models have defined market segments of their very own. For almost a decade, the EVOLUTION has been the leader in the field of manually operated vertical panel saws. The CONTROL is almost without any competition in the premium category. However, this lead has not induced Striebig to rest on its laurels. With even more automation of sawing operations and additional special equipment options, the new CONTROL series has become the first vertical panel cutting centre: it now has the functions of a horizontal cutting centre with the well-known classic benefits, which include low space requirements and the superb price-performance ratio offered by vertical sawing technology.

(Long version cont'd)

What is completely new on the CONTROL series is the opportunity to combine the special equipment option “4SB” for lower trimming cuts with “ABO”, the option for automatic upper trimming cuts. “EPS”, the electronic positioning system, has been specially enhanced for the CONTROL series: it has been fully integrated into the touchscreen panel and makes for easy positioning of the cutting axes for horizontal and vertical cuts down to an accuracy of 1/10 mm.

The level of standard equipment fitted to its saws is one of the company’s particular concerns. “As market leader, we are aware of and have the experience of the everyday demands of our processors. Comprehensive basic equipment is a matter of course to us and there are no long lists of extra charges”, emphasised Striebig’s business manager Marcel Brunner when presenting the new machines.

In their standard versions, the CONTROL and EVOLUTION models offer levels of equipment that are almost unobtainable elsewhere even as options. Two examples include the laser-supported display for horizontal cuts and the aluminium central support along the full length of the machine.

Hall 11 at Ligna 2009 is where you will find the stand of Striebig AG of Littau – a convincing debut with the new saws. With its decades of experience, major commitment by the development team and the reliability of proven partners in the specialist trade, the Swiss market leader stands for constancy and creates lasting values: STRIEBIG is and remains the synonym for vertical sawing technology.

(Abridged version)

Twin debut for Striebig

Touch and go ...

Swiss panel saw specialist Striebig is presenting two global innovations at Ligna: the company's new CONTROL model, which is the world's first vertical panel cutting centre, and its new EVOLUTION model, which is the top-of-the-range model for manually operated vertical panel saws. Both saws share the company's innovative "touch & saw" operating system via a touchscreen panel. A fingertip touch is all it needs to operate all the functions of the machine.

With enhanced automation of sawing operations and additional special equipment options, the new CONTROL series has become a vertical sawing centre. It combines the functionality of a horizontal cutting centre with the classic benefits – including space requirements and cost effectiveness – of vertical sawing technology. What is new on CONTROL models is the opportunity to combine the following special equipment options - "4SB" for lower trimming cuts and "ABO" for automatic upper trimming cuts.

The level of standard equipment fitted to its saws is one of the company's particular concerns. "As market leader, we are aware of and have the experience of the everyday demands of our processors. Comprehensive basic equipment is a matter of course to us and there are no long lists of extra charges", explained Striebig's business manager Marcel Brunner when presenting the new machines. In their standard versions, the CONTROL and EVOLUTION models offer levels of equipment that are almost unobtainable elsewhere even as options. Two examples include the laser-supported display for horizontal cuts and the aluminium central support along the full length of the machine.

Hall 11 at Ligna 2009 is where you will find the stand of Striebig AG of Littau – a convincing debut. With its decades of experience, major commitment by the development team and the reliability of proven partners in the specialist trade, the Swiss market leader stands for constancy and creates lasting values: STRIEBIG, the synonym for vertical sawing technology.
